DECLARATION

We, hereby declare the work, which is being presented in the project, entitled “Accessibility in Digital World” in partial fulfillment of the requirements for the award of the degree of Bachelor of Computer Application, is an authentic record of my own work carried out under the supervision of Mr. Amiya Dhar Dwivedi

The matter embodied in this project has not been submitted by us or anybody else for the award of any other degree in any other University/Institution.

Deepanshu Kumar	2302031601034	(A)
Mayank Jain	2302031601051	(A)
Chetan Sharma	2302031601030	(A)
Prachi	2302031601130	(A)

Date:

ACKNOWLEDGEMENT

I am grateful to many people who have helped me throughout my BCA. First, I would like to thank my supervisor Mr. Amiya Dhar Dwivedi and Dean (Dr. Awakash Mishra) for their intimacy and for their great support during all the steps of this report. I would also like to thank my faculty members and my colleagues for their valuable suggestions. Besides my colleagues, I appreciate the care and support of my good friends, who always encouraged me towards this research work.

Deepanshu Kumar

CHAPTER-1

1.0 Introduction

In today's technology-driven world, digital platforms have become essential for performing everyday activities such as shopping, communication, education, banking, and entertainment. However, millions of people with disabilities including visual impairments, hearing difficulties, motor challenges, cognitive limitations, and speech disabilities still face barriers while accessing websites and applications. Accessibility in a Digital World is an initiative that focuses on removing these barriers and ensuring that every individual, regardless of their disability, can experience technology equally, independently, and comfortably.

This project focuses on building an e-commerce platform equipped with multiple accessibility features to support users with different disabilities. Through tools like Read Aloud for blind users, Contrast Mode for low-vision users, Sign Language Mode for deaf users, Voice Commands for motor-disabled users, and Font Resizing for users with cognitive challenges, the platform demonstrates how thoughtful design can enhance digital inclusivity. By integrating these features into a real functional website, the project shows how technology can empower differently-abled individuals to navigate the digital world with confidence and independence.

The purpose of this project is not only to create an accessible shopping experience but also to highlight the importance of inclusive digital design. It spreads awareness that accessibility is not an optional add-on; it is a responsibility that ensures equal digital rights for everyone. In a modern world where technology touches every aspect of life, accessibility becomes the foundation of a fair, user-friendly, and socially responsible digital ecosystem.

1.1 Objectives

In today's digital world, websites, apps, and online tools are widely used, but many are not designed for people with visual, hearing, motor, or cognitive challenges.

The main objectives of the project are:

- To provide **Text-to-Speech (Read Aloud)** functionality for visually impaired users.
- To allow users to **stop reading** anytime for complete control.
- To provide **font size increase and decrease** options for users with low vision or reading difficulties.
- To implement **Dark Mode** for users who face eye strain or prefer high-contrast design.
- To offer **Voice Command** support so users with motor difficulties can control the webpage hands-free.
- To include **basic Sign Language support**, helping hearing-impaired users understand web content.
- To implement **keyboard shortcuts** for faster navigation without using a mouse.
- To make the webpage more inclusive and user-friendly for all users.

1.2 Definition of Problem

Most digital platforms today are not fully accessible. Users with disabilities face challenges like:

- Unable to read images or videos without descriptions
- Difficulty navigating sites without a mouse
- Poor color contrast making text unreadable
- Inaccessible forms or interactive elements

This problem reduces opportunities for education, employment, and information access for people with disabilities. Our project aims to identify these gaps and create a platform that everyone can use easily.

1.3 System Analysis & Design via User Requirements

System Analysis involves understanding what users need to interact with digital platforms without barriers.

User requirements include:

- Screen readers support for visually impaired users
- Clear headings and content structure
- Accessible forms and input fields
- Video captions and audio descriptions

System Design ensures the platform is easy to navigate, intuitive, and follows accessibility standards. Using user-centered design methods, the system will meet the needs of all users.

1.4 Methodology and System Planning

The project will use a step-by-step approach:

1. **Requirement Gathering:** Understanding accessibility issues through research and surveys.
2. **Design:** Creating diagrams like context diagrams and E-R diagrams.
3. **Development:** Using HTML, CSS, JavaScript, and Tailwind CSS to build the platform.
4. **Testing:** Checking accessibility with tools like WAVE, Lighthouse, and screen readers.
5. **Deployment:** Launching the platform for real users.

This method ensures that all accessibility standards are followed while maintaining usability for everyone.

1.5 Proposed System

The proposed system provides a unified accessibility toolbar that contains all essential tools needed by users with disabilities.

Main Features of the Proposed System:

- **Read Aloud (Text-to-Speech):** Reads selected text or page content for visually impaired and elderly users.
- **Stop Reading:** Allows the user to immediately stop TTS output anytime.
- **Font Size Increase & Decrease:** Helps users with low vision or dyslexia read the content comfortably.
- **Dark Mode:** Provides high contrast and reduces eye strain for long reading sessions.
- **Voice Commands:** Allows users to perform actions (read, stop, zoom, change mode) with voice input.
- **Sign Language Support:** Displays basic sign-language gestures for essential instructions (e.g., welcome, thank you, click).
- **Keyboard Shortcuts:** Enables quick access without using a mouse:
 - **CTRL + ↑** → Increase Font
 - **CTRL + ↓** → Decrease Font
 - **CTRL + k** → Dark Mode
 - **CTRL + R** → Read Text
 - **CTRL + x** → Stop Reading

This system removes the dependency on external screen readers and makes the website self-supportive.

1.6 Feasibility Study

1. Technical Feasibility

- All features (TTS, dark mode, keyboard shortcuts, etc.) are supported by web technologies like **JavaScript**, **Web Speech API**, and **CSS**.
- Sign-language animations can be integrated using GIFs or Lottie files.
- No additional hardware is required. Therefore, the project is technically feasible.

2. Operational Feasibility

- The system is simple and can be used by visually impaired, motor-disabled, or hearing-impaired users.
- Voice commands and keyboard shortcuts reduce manual effort.
- Dark mode and font resizing give better readability. Users can easily operate the system without training.

3. Economic Feasibility

- The entire system uses freely available technologies, so the cost is very low.
- No paid software or external libraries are required.
- Only development time is the main effort. Thus, the project is economically feasible.

1.7 Hardware & Software Requirements

Hardware Requirements:

- Laptop or PC with at least 4GB RAM
- Internet connection for testing online accessibility tools
- Monitor with good resolution for testing color contrast

Software Requirements:

- **Front-end:** HTML, CSS, JavaScript.
- **Back-end:** Python (Flask), Database: MySQL
- **Tools:** VS Code for accessibility testing
- **Browser:** Chrome, Firefox, Edge for cross-browser testing

CHAPTER-2

2.0 What is DFD & How to Prepare a DFD?

A Data Flow Diagram (DFD) is a graphical tool used to represent how data moves inside a system. It focuses on data flow, not program logic or design structure. It shows:

- Where data originates from
- How the system processes it
- What modules interact with it
- How output is generated

DFDs are widely used in system analysis because they are easy to understand even for non-technical users.

How to Prepare a DFD?

To prepare a DFD, follow these steps:

1. Identify external entities — such as the User.
2. Identify main processes — like Read Text, Font Resize, Dark Mode, etc.
3. Identify data flows — commands, text input, settings.
4. Identify data stores — user preferences (optional).
5. Draw Level 0 as one big process.
6. Break it down into Level 1 processes.
7. Further expand critical processes in Level 2 for clarity.

DFDs help understand the functional model of the system before writing any code.

2.1 DFD (At least up to Level 2)

1. Level 0 DFD (Context Diagram)

Shows the entire system as a single process.

User → Accessibility System → Output (Read, Dark Mode, Font Change, etc.)

2. Level 1 DFD

Breaks the main system into sub-modules:

- **Process 1:** Text-to-Speech (Read/Stop)
- **Process 2:** Font Size Controller
- **Process 3:** Dark Mode Module
- **Process 4:** Voice Command Processor
- **Process 5:** Sign Language Display
- **Process 6:** Keyboard Shortcut Handler

User Input → Modules → Page Display (Updated)

3. Level 2 DFD

Further expands each module.

Example: Text-to-Speech Module

- Receive selected text
- Convert text to speech
- Output audio
- Stop signal ends speech

Example: Font Module

- Detect increase/decrease command
- Adjust CSS font size

- Update webpage view

Example: Voice Command

- Capture voice
- Convert speech to text
- Identify command
- Execute action

Fig. 1 DFD diagram

2.2 Database Design

Purpose of Database

The database is created to store user information securely for login and signup purposes.

A main Users table is used, which stores details like name, email, and password.

- The email is kept unique so that no two users can register with the same email.
- The password is stored in encrypted (hashed) form to ensure security.

Tables in the Design

1. User Table

Stores basic user info.

Field	Type	Description
user_id	INT	Primary Key
name	VARCHAR	User Name
email	VARCHAR	Email Address

Table 1: User Table

2.3 ER Diagram

1. What is an ER Diagram?

An Entity Relationship (ER) Diagram represents the relationship between data entities in a system. It is a key component in database design and helps developers understand how different data units interact.

2. How to Prepare an ER Diagram & Its Uses

Steps to Prepare ER Diagram

1. Identify **entities** (User, Preferences).
2. Identify **attributes** (font size, theme).
3. Identify **primary keys** (user_id, pref_id).
4. Determine **relationships** (User HAS Preferences).
5. Draw the ER model with proper notations.

Uses of ER Diagram

- Prevents database errors
- Ensures data integrity
- Supports efficient database normalization
- Serves as blueprint for backend developers
- Simplifies maintenance and future upgrades

3. ER Diagram of your System

Fig. 2 Er diagram

2.4 Flow Chart

1. Definition

A **Flowchart** is a graphical representation of the sequence of operations in a program or system. It clearly shows how the system behaves step-by-step.

Flowcharts are useful for:

- Understanding system logic
- Debugging
- Explaining workflow to non-technical people
- Creating structured programs

2. Symbols Used in Flowcharts

Symbol	Meaning	Description
Oval (○)	Start/End	Beginning or end of the process
Rectangle (□)	Process	Represents an action / operation
Diamond (◇)	Decision	Yes/No or True/False checking
Parallelogram (▭)	Input/Output	User input or system output
Arrow (→)	Flow line	Shows direction of workflow

Table 2: Symbols used in flowchart

Fig 3 Flow chart of proposed system

2.5 Meta Data

Metadata means “data that describes other data.” In this project, metadata helps control and manage accessibility settings.

Types of Metadata Used in This Project

- **Font Metadata:** Stores current font size.
- **Theme Metadata:** Stores whether dark mode is on.
- **Voice Metadata:** Stores last recognized speech command.
- **Shortcut Metadata:** Identifies activated keyboard shortcuts.
- **Sign Language Metadata:** Stores reference to gesture animation.

Why Metadata Is Important?

- Improves consistency in user experience
- Helps restore user preferences
- Allows smooth switching between modes
- Helps voice commands understand previous context
- Enhances performance by reducing repetitive calculations

CHAPTER-3

3.0 Cost and benefits analysis

The Accessibility in Digital World system is designed using simple and cost-effective technologies such as HTML, CSS, JavaScript, Tailwind CSS, and basic browser APIs. Since the system does not require advanced backend modules or expensive software licenses, the overall development cost remains extremely low. Despite minimal cost, the system provides significant benefits improving usability for visually impaired, hearing-impaired, elderly, and motor-disabled users.

1. Cost Analysis:

- Development costs: designing and coding the website
- Testing tools: some accessibility tools may be paid

2. Benefits Analysis:

Benefit	Description	Impact
Social Impact	Empowers people with disabilities to access digital content independently	High
Legal Compliance	Meets accessibility standards like WCAG, ADA, and other regulations	Medium-High
Market Expansion	Attracts a wider user base including differently-abled users	High
Improved User Experience	Enhances usability for all users, not just disabled users	Medium
Brand Reputation	Positive perception of organization as inclusive and socially responsible	High

Future Integration	Easily extendable to AI, IoT, and mobile apps	Medium
---------------------------	---	--------

Table 3: Benefit analysis

Return on Investment (ROI): Though the project has a moderate initial cost, the social benefits, compliance with legal standards, and potential market expansion provide high long-term returns.

3.1 Challenges

1. Technical Challenges

- Integration of advanced assistive technologies like AI-based voice commands and real-time captioning can be complex.
- Ensuring cross-browser and cross-device compatibility for all accessibility features.
- Maintaining database security while storing user accessibility preferences.

2. Financial Challenges

- Initial setup and integration of accessibility tools may be costly for small organizations.
- Continuous updates and maintenance require recurring investment.

3. User Adoption Challenges

- Users may require training to use advanced accessibility features effectively.
- Some users may not be aware of the accessibility tools available on the platform.

4. Regulatory Challenges

- Keeping the system compliant with evolving accessibility standards and laws.
- International users may have different accessibility expectations and legal requirements.

5. Design & Usability Challenges

- Balancing an accessible interface with an attractive and user-friendly design.
- Avoiding overload of features which might confuse users.

While the project involves significant initial investment and technical challenges, the long-term benefits social impact, legal compliance, user satisfaction, and brand reputation far outweigh the costs. Careful planning, phased implementation, and continuous user feedback are crucial to overcoming challenges.

CHAPTER-4

4.0 Snapshots

1. Homepage (ElectroMart)

1. Homepage Overview

The homepage of ElectroMart is designed to offer a clean, user-friendly, and visually appealing interface for customers looking to buy electronic accessories. It features a simple layout with quick navigation, product categories, and top deals to enhance user experience.

2. Header Section

Search Bar

- A prominent search bar at the top allows users to quickly search for electronic products.
- Helps users locate items like mobiles, laptops, speakers, and more.

User Account Options

- Login
- Admin

- Cart

These provide easy access to account management and shopping cart.

3. Main Navigation Categories

The homepage displays the primary product categories with icons:

- Mobiles
- Laptops
- Watches
- Earbuds
- Speakers

This helps users quickly jump to their desired category.

4. Hero Banner Section

A large, attractive banner showcases various electronic products such as headphones, tablets, gaming consoles, smartwatches, and speakers.

2. Contrast Feature:

1. Introduction to Contrast Mode

The Contrast Mode is an important accessibility feature included in ElectroMart to help users with low vision, color blindness, or visual strain. This mode improves visibility by increasing the contrast between text, icons, and the background.

When activated, the homepage switches to a high-contrast theme, making the content easier to read and navigate.

2. Purpose of the Contrast Feature

- To assist users with visual impairments.
- To reduce eye strain in low-light environments.
- To ensure that text and UI elements are distinguishable.
- To make the website more accessible and inclusive for all users.

3. Sign Language Feature

Sign Language Mode in ElectroMart is an accessibility feature designed to support users who are deaf, hard of hearing, or non-verbal. Instead of relying on spoken instructions or audio cues, this feature provides keyboard-based shortcut actions that convert common website operations into an easy-to-understand sign language command interface. When the user enables Sign Language Mode, a popup appears showing all available actions and their corresponding keyboard buttons.

4. Signup Page

The Signup Page of ElectroMart provides a simple, clean, and user-friendly interface that allows new users to create an account easily. The page contains a centered registration form with essential fields such as Full Name, Email, and Password, ensuring that only the minimum required information is collected for creating a secure user profile. A clear Create Account button submits the form, while a link below offers quick navigation to the Login page for existing users.

The screenshot displays the 'Signup' page of ElectroMart. At the top, a dark blue header bar contains the word 'Signup' in white. The main content area is light gray and features a centered white card titled 'Create Account'. Inside the card, there are three input fields: 'Full Name' with the placeholder 'Enter your full name', 'Email' with 'Enter your email', and 'Password' with 'Create a password'. Below these fields is a prominent blue button labeled 'Create Account'. Underneath the button, a link reads 'Already have an account? [Login](#)'. At the bottom of the page, a dark gray footer bar contains several utility icons and labels: a magnifying glass for 'Read', a red stop circle for 'Stop', 'A+' and 'A-' for font size, a sun for 'Contrast', a speaker for 'Voice', and a yellow lightning bolt for 'Sign'.

5. Login Page

The Login Page of ElectroMart provides a simple and streamlined interface for returning users to access their accounts securely. The layout features a centered login form containing two essential fields Email and Password ensuring a quick and straightforward authentication process. A prominent Login button allows users to submit their credentials, while a link below directs new users to the Signup page, making navigation smooth and intuitive.

The screenshot displays the ElectroMart Login Page. At the top, a dark blue header bar contains the word "Login" in white. The main content area is a light gray background. In the center, there is a white login form with a subtle shadow. The form is titled "Login" in bold. It contains two input fields: "Email" with the placeholder text "Enter your email" and "Password" with the placeholder text "Enter your password". Below these fields is a blue "Login" button. Underneath the button, there is a link that says "Don't have an account? [Signup](#)". At the bottom of the page, there is a dark gray footer bar with several icons and labels: "Read", "Stop", "A+", "A-", "Contrast", "Voice", and "Sign".

6. Admin Page

The Admin Page of ElectroMart serves as the central control panel for managing the entire e-commerce platform. It provides a structured dashboard where administrators can monitor key metrics such as Total Products, Total Orders, Registered Users, and Total Revenue. These statistics give a quick overview of platform performance and user activity.

The page includes a dedicated Add Product section, allowing admins to easily input product details such as name, price, image URL, and description. This ensures quick and efficient listing of new items. Below this, the Manage Products module displays all existing products in a tabular format with options to update or delete items, enabling smooth inventory management.

7. Product Page

The Product Page of ElectroMart provides a detailed and visually appealing presentation of each item, helping users make informed purchasing decisions. At the top, the page displays a high-quality product image along with key information such as the product name, color, and storage variant. The price is highlighted clearly, followed by customer ratings and reviews to build trust and transparency.

A brief product description summarizes the main features, and users are offered two quick-action buttons Add to Cart and Buy Now ensuring a smooth and fast shopping experience. The lower section of the page includes a comprehensive Product Specifications table outlining details such as brand, model, RAM, storage, battery, and processor, giving customers complete clarity about the technical attributes.

8. Add to cart page

The Add to Cart Page in ElectroMart provides a clear overview of all products selected by the user before checkout. Each item in the cart is displayed with its image, name, key specifications (such as color, RAM, and storage), and the price. A quantity selector allows users to update the number of units they want to purchase, ensuring full control over their order.

Below the product list, the Order Summary section shows the total number of items and the final payable amount, helping users quickly review the cost. A prominent Proceed to Buy button guides the user toward the checkout process in a single click, keeping the flow fast and user-friendly.

9. Order Page

The Order Page provides users with a clear and organized overview of all the purchases they have made on ElectroMart. Each order is displayed with key details such as the product name, order ID, price, quantity, and current order status. This helps users easily track their purchases and stay informed about delivery progress.

10. Track your Order page

The Track Your Order page allows customers to monitor the real-time status of their purchase using the Order ID. This page shows clear status steps such as Order Confirmed, Packed, Shipped, and Out for Delivery, helping users understand exactly where their product is in the delivery process.

With a minimalistic design and accessibility controls like voice navigation, text-to-speech, and sign language mode, users with visual or hearing impairments can effortlessly check the progress of their order. The tracking interface is intuitive, accurate, and ensures a transparent delivery experience.

4.1 Future scope

The project “Accessibility in a Digital World” aims to enhance the usability of digital platforms for people with disabilities, including visual, hearing, motor, and cognitive impairments. While the current system provides basic accessibility tools, there is significant potential for growth and improvement. The future scope can be divided into several areas:

1. Advanced Accessibility Features

- **AI-Powered Assistive Technologies:** Integration of artificial intelligence to provide features like voice-controlled navigation, predictive text input, and context-aware suggestions for users with motor or visual impairments.
- **Real-Time Captioning & Translation:** Automatic speech-to-text conversion for live content, supporting multiple languages for hearing-impaired users.
- **Gesture & Eye-Tracking Controls:** Implementing gesture recognition and eye-tracking technology to allow users to interact with the system without traditional input devices.

2. Personalization and Adaptive Learning

- **Customizable User Profiles:** Users can set preferences for font size, contrast, voice speed, and interaction methods, making the system adaptable to individual needs.
- **Adaptive UI/UX:** Dynamic interfaces that adjust automatically based on user behavior, difficulty levels, or specific accessibility requirements.

3. Integration with IoT and Smart Devices

- **Smart Home Connectivity:** The system can integrate with IoT devices, enabling users to control lights, appliances, and security systems through accessible interfaces.
- **Wearable Device Support:** Integration with smartwatches or AR glasses for real-time notifications, navigation assistance, and health monitoring.

4. Enhanced Data Management and Analytics

- **User Behavior Analysis:** Using analytics to understand accessibility challenges, track user engagement, and improve system recommendations.

- **Cloud Integration:** Secure cloud-based storage to allow users to access accessibility settings and preferences across multiple devices.

5. Community and Collaborative Features

- **Crowdsourced Accessibility Feedback:** Allowing users to report accessibility issues in websites or applications, creating a continuously improving ecosystem.
- **Collaborative Tools for Educators and Employers:** Features to help teachers and organizations create accessible content for students or employees.

6. Expansion Across Platforms

- **Mobile App Development:** Extending accessibility features to iOS and Android platforms for wider reach.
- **Multilingual Support:** Enabling accessibility tools for users who speak different languages, promoting global inclusivity.

CHAPTER-5

5.0 Conclusion

The project “Accessibility in Digital World” successfully implements essential accessibility features that help visually impaired, hearing-impaired, elderly, dyslexic, and motor-disabled users navigate a webpage with ease. The system focuses on real, practical features such as text-to-speech, stop reading, font resizing, dark mode, voice commands, keyboard shortcuts, and basic sign-language support.

These features allow users to interact with digital content more comfortably, making the webpage inclusive and user-friendly. The project demonstrates how accessibility can be implemented using simple front-end technologies like HTML, CSS, JavaScript, and Web Speech APIs without requiring complex or expensive tools.

Overall, the system improves usability, reduces digital barriers, and helps promote the importance of accessible design in modern websites.

5.1 Advantages

1. Beneficial for Visually Impaired Users

- The Read Aloud feature helps users who cannot read text properly.
- Font resizing improves readability for low-vision users.

2. Useful for Motor-Disabled Users

- Voice commands allow hands-free control of the webpage.
- Keyboard shortcuts reduce dependency on the mouse.

3. Helpful for Hearing-Impaired Users

- Basic Sign Language animations assist users with hearing difficulties.

4. Reduces Eye Strain

- Dark mode improves visual comfort, especially in low-light environments.

5. Simple and Lightweight

- Works on any device and browser since it uses pure JavaScript.
- No heavy backend or server is required.

6. Improves Accessibility Compliance

- Helps websites follow basic WCAG (Web Content Accessibility Guidelines).
- Encourages inclusive design in educational and public websites.

7. Better User Experience

- Users can personalize the website according to their needs.
- Fast, smooth, and intuitive controls.

5.2 Limitations

1. Limited Sign Language Support

- Only basic gestures are implemented.
- Full ASL/ISL interpretation is not supported.

2. Voice Commands Depend on Microphone Quality

- Poor microphone or background noise may lead to inaccurate recognition.
- Works best in quiet environments.

3. No Database Integration

- User preferences (font size, theme) are not stored permanently.
- Settings reset after page refresh unless local storage is added.

4. Not Compatible with All Browsers

- Some browsers may not fully support Web Speech API.
- Older browsers lack TTS and speech recognition features.

5. Basic UI

- The system is functionally strong but visually simple.
- More animations and modern UI design can be added.

6. Limited to Text-Based Content

- Image descriptions (alt text reading) are not implemented.
- Cannot read PDFs or embedded documents.

5.3 Enhancements (Future Work)

1. Full Sign Language Integration

- Add advanced, AI-based sign language recognition and translation.
- Support more gestures and phrases.

2. Add User Preference Storage

- Save settings in database or Local Storage.
- Automatically load font size, theme, and preferences on next visit.

3. Improve Voice Command Accuracy

- Use advanced NLP libraries to understand natural language.
- Add more command categories.

4. Add Multi-Language Support

- Text-to-Speech and Voice Commands in Hindi, English, Punjabi, etc.
- Helpful for non-English users.

5. Add Screen Reader Compatibility

- Proper ARIA roles and labels for blind users.
- Auto-reading of navigation menus and buttons.

6. Improve UI and Accessibility Toolbar

- More animations, icons, modern design.
- Floating toolbar with customizable layout.

7. Add AI-Based Accessibility Suggestions

- System suggests best settings based on user behavior.
- Example: automatically increase font for repeated zoom-in.
